### management solutions

**Axis is an image management solution offered exclusively by Aris Teleradiology. The Axis solution provides Aris clients with an Applications Service Provider (ASP) model for storing, and managing clinical data. Axis is not just a PACS product, it is a complete system that allows for image distribution, reporting, and archiving on a robust, secure and redundant system.**

Many physician group practices delay the decision to incorporate a PACS solution due to the high cost of a fully digital image management solution. Axis allows providers to upgrade their capabilities and improve efficiency without changing their current

network. Our solution will allow you to quickly access digital images from virtually any PC. Axis also allows you to transmit data immediately from one location to another. All that is needed is an internet connection.

#### **BENEFITS OF THE AXIS SYSTEM**

**Web based** - Allows for ease of integration and ability to access images from any computer.

**Immediate Access** - Saves time while eliminating possible errors in image retrieval.

**Redundant storage** - Provides disaster recovery features while eliminating image storage space and costs.

**Scaleable** - Allows customers to add features when necessary and eliminate obsolete equipment.

**Customizable** - Provides a customized solution based on your current infrastructure and workflow determined with help from an Aris expert analysis.

**Ease of use** - Offers a simple, user friendly operating system for immediate implementation.
